Sample Review Questions and Answers from Modern Biology 15 2

Below are some example questions and their corresponding review answers to illustrate how this resource can be used effectively.

Question 1: What are the main stages of the cell cycle?

- **Interphase:** The cell grows, performs its normal functions, and prepares for division. It includes G1, S, and G2 phases.
- **Mitotic phase:** Consists of mitosis (nuclear division) and cytokinesis (cytoplasm division).

Mitosis has phases: prophase, metaphase, anaphase, and telophase.

Review Answer Summary:

During interphase, the cell prepares for division by replicating DNA and organelles. Mitosis ensures equal distribution of chromosomes into two daughter cells. Cytokinesis divides the cytoplasm, completing cell division.

Question 2: How does meiosis contribute to genetic variation?

Review Answer:

Meiosis introduces genetic variation through two main processes: crossing over during prophase I, which exchanges genetic material between homologous chromosomes, and independent assortment during metaphase I, which randomizes the distribution of maternal and paternal chromosomes to gametes. These mechanisms produce genetically unique gametes, essential for evolution and species diversity.

Question 3: Explain the process of DNA replication.

Review Answer:

DNA replication is a semi-conservative process involving the unwinding of the double helix by helicase enzymes. Complementary nucleotides are added to each original strand by DNA polymerase, following base pairing rules (A with T, G with C). This results in two identical DNA molecules, each consisting of one original and one new strand.
