Sample Phet Circuit Lab Questions and Answers

Below are typical questions encountered in the simulation and suggested approaches to solving them:

Question 1: What happens to the brightness of the light bulb when you increase the voltage from the battery?

Answer: Increasing the voltage increases the current flowing through the circuit, which results in the light bulb shining brighter. This demonstrates Ohm's law, where voltage and current are directly proportional when resistance is constant.

Question 2: How does adding resistors in series affect total resistance?

Answer: When resistors are added in series, their resistances sum up, increasing the total resistance. This reduces the current in the circuit, which can be observed by measuring voltage drops across each resistor.

Question 3: What is the effect of connecting resistors in parallel compared to series?

Answer: Resistors in parallel decrease the total resistance of the circuit, allowing more current to flow. This can be observed by measuring the current and voltage across components, noting the increased current flow compared to a series configuration.
